UI Screen Shots and their Description

Home Page- Event Discovery and Navigation

The Home page serves as the primary entry point of the application. It is designed to help users quickly discover upcoming events, explore categories, search for specific events, and navigate to detailed event pages.

Introduction Section

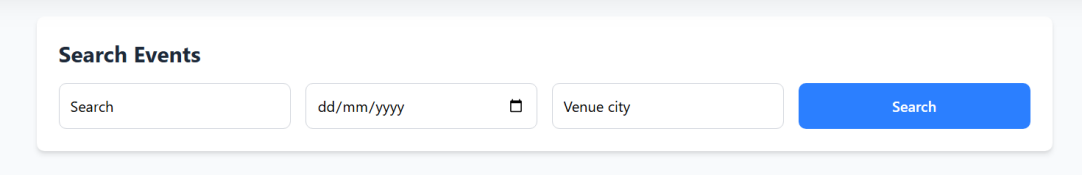

At the top of the page, a visually prominent hero banner introduces the platform with a headline and supporting text. A featured image is displayed alongside short descriptive content to immediately engage users.

UI purpose:

- Creates a strong first impression
- Communicates the platform's purpose clearly
- Encourages users to start browsing events

Search Functionality

Below the hero section, a search component allows users to find events based on keywords or filters. The results are dynamically updated and displayed within the event list.

UI purpose:

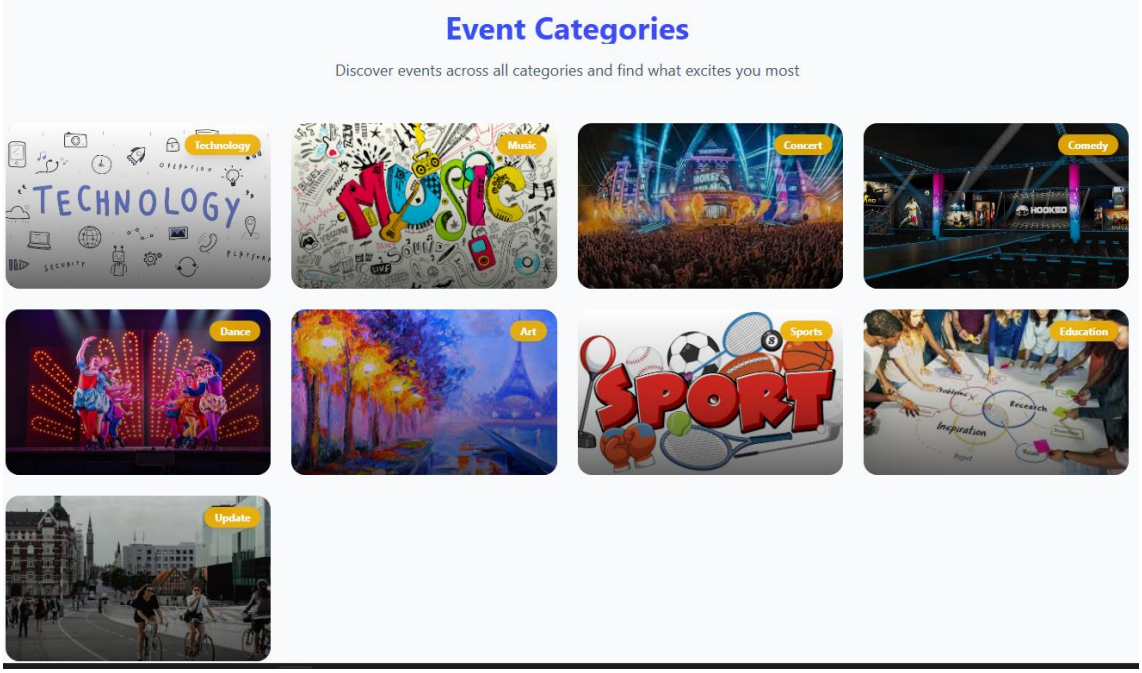

- Enables fast access to relevant events
- Reduces time spent scrolling
- Improves overall user efficiency

Category List Section

The category list component allows users to browse events by category (e.g., Music, Theatre, Live Events). This supports structured navigation and content discovery.

UI purpose:

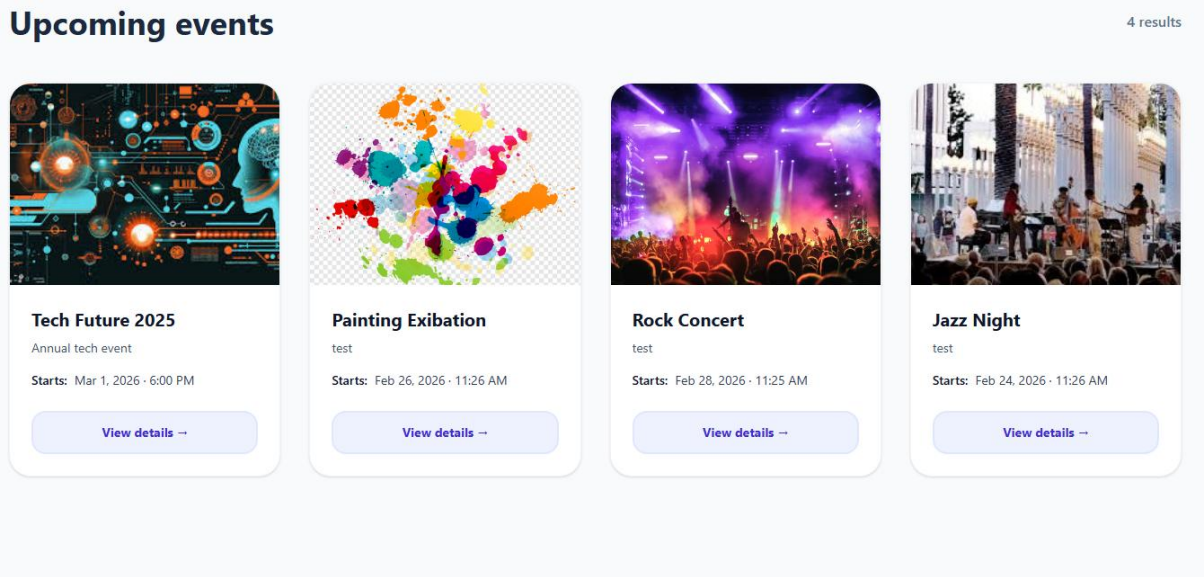

- Organizes events into logical groups
- Helps users explore based on interests
- Improves information architecture

Upcoming Events Section

This section displays a grid of upcoming events only, filtered based on the event start date. Each event card includes:

- Event image (with fallback if unavailable)
- Event title
- Short description
- Start date and time
- Category labels
- "View details" button

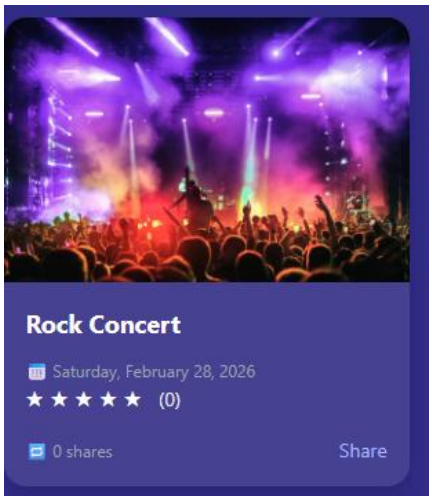

UI purpose:

- Ensures users see only relevant future events
- Provides clear and scannable event metadata
- Encourages navigation to the event detail page

Event Cards Design

Each event is displayed as a card with consistent layout and hover interactions. Category badges and visual hierarchy help users quickly identify event type and importance.

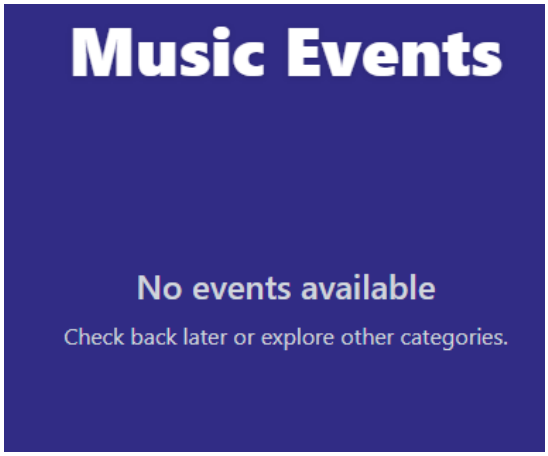

UI purpose:

- Improves readability and visual consistency
- Supports quick comparison between events
- Enhances user interaction through visual feedback

Error Handling

When no upcoming events are available, the interface displays a clear empty state message with an icon and explanatory text.

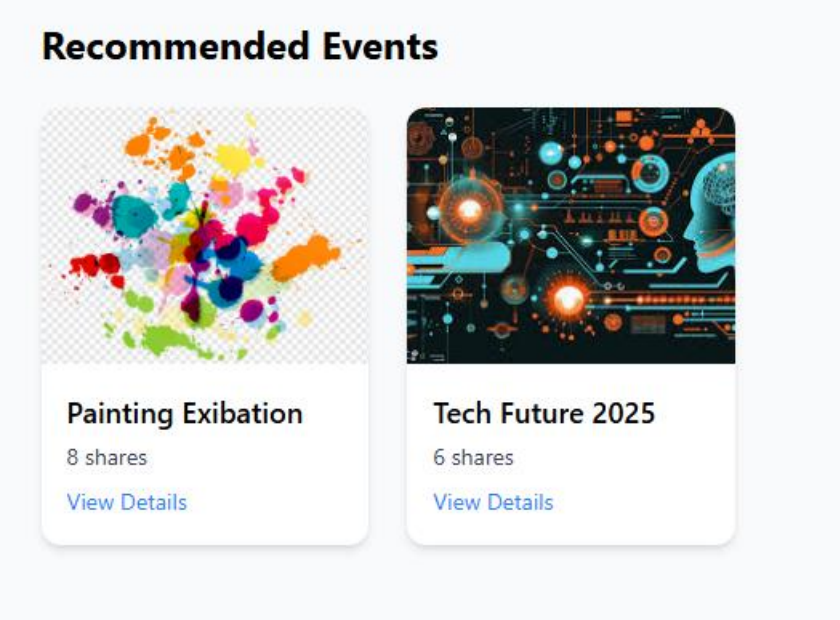

UI purpose:

- Prevents confusion when no data is available
- Maintains a polished user experience
- Communicates system status clearly

Recommended Events Section

A dedicated Recommended Events component displays curated or suggested events to users, increasing engagement and content discovery.

UI purpose:

- Promotes featured or popular events
- Encourages users to explore beyond search results
- Enhances personalization

Access Control

This page is accessible to all users. Event creation, editing, and administrative controls are restricted to authorized roles such as admins and organizers and are not visible on this interface.

Category Detail & User Engagement Interface

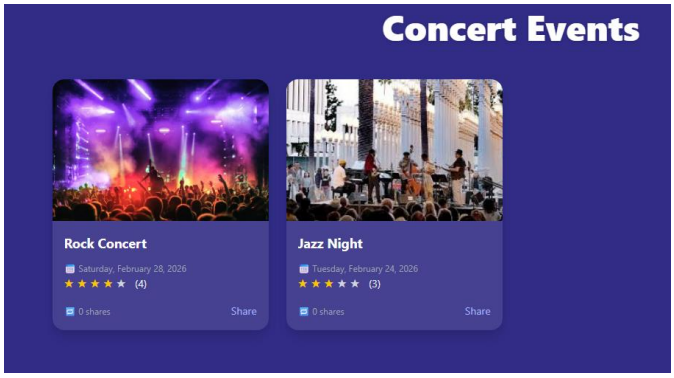

Feature Access and Visibility

The Category Detail interface is publicly accessible to authenticated and unauthenticated users. Interactive features such as event rating and personalized social sharing attribution require the user to be logged in. This design balances accessibility with controlled user interaction.

Purpose of the Feature

The Category Detail interface allows users to browse events within a selected category and interact with them through viewing, rating, and social sharing. The feature is designed to improve event discoverability, encourage user engagement, and support organic promotion through social platforms.

Category-Based Event Listing

The above diagram illustrates the events belonging to a selected category displayed in a responsive grid layout. Each event is presented as an interactive card containing key event information.

UI Elements

- Category title displayed at the top of the page
- Event cards arranged in a responsive grid
- Event image with fallback support
- Event title, description, and scheduled date

User Value

This allows users to quickly explore events relevant to their interests in a visually structured and accessible format.

Event Navigation

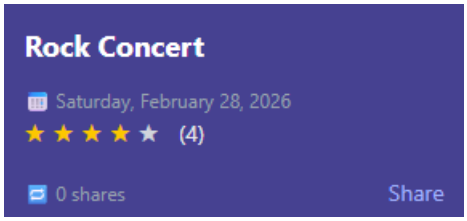

Each event card is clickable and redirects the user to a detailed event page.

User Value

This provides a seamless navigation flow from category exploration to detailed event information and booking.

Event Rating System (see above image)

Users can rate events using a five-star rating system displayed on each event card.

UI Elements

- Five interactive star icons per event
- Visual feedback highlighting the selected rating
- Display of the average rating per event

User Value

This feature enables users to express feedback and view collective opinions, supporting informed decision-making when choosing events.

Social Sharing Functionality

Users can share event links across multiple social media platforms directly from the category view.

UI Elements

- Share count displayed per event
- Toggleable share button revealing platform-specific options
- Supported platforms include Facebook, Twitter (X), and WhatsApp

User Value

Social sharing encourages organic promotion of events while providing visibility into how often an event is shared.

Share Count Tracking

Each event displays the total number of social shares it has received. Share counts are updated dynamically after a successful share action.

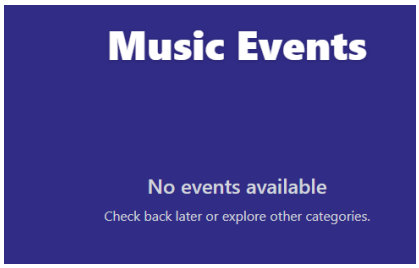

User Value

This provides social proof and highlights popular events within a category.

Feature 6: Empty State Handling

If no events are available within a category, a clear empty state message is displayed.

User Value

This improves usability by clearly communicating system state and guiding user expectations.

Design and Usability Considerations

Responsiveness:

The grid layout adapts to different screen sizes, ensuring usability across devices.

Visual Hierarchy:

Event images, titles, and interaction elements are prioritized for quick scanning.

Interaction Control:

Click event propagation is managed to prevent accidental navigation when interacting with ratings or sharing features.

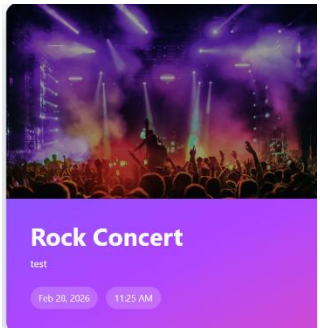

Feedback Visibility:

Ratings and share counts provide immediate visual feedback to users.

Event Detail and Ticket Booking Interface

Event Detail and Booking Screen

This screen represents the Event Detail interface, where users can view detailed information about a selected event and complete the ticket booking process. The design focuses on clarity, usability, and a step-by-step booking flow.

Event Overview Section

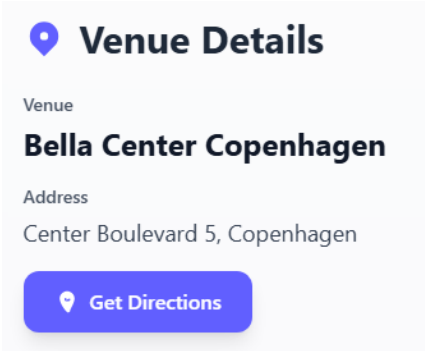

At the top of the screen, the event's featured image, title, description, date and time are displayed prominently.

This section provides users with essential information briefly and helps them decide whether to proceed with booking.

UI purpose:

- Visual engagement through a large banner image
- The interface provides a clear presentation of event metadata such as the event name, date, time, location and pricing, allowing the user to quickly understand key event details.
- Improves user confidence before purchasing tickets

Venue Information Panel

The venue details include:

- Venue name
- Address and city
- A "Get Directions" button linked to Google Maps

This allows users to quickly locate the event venue without leaving the application manually.

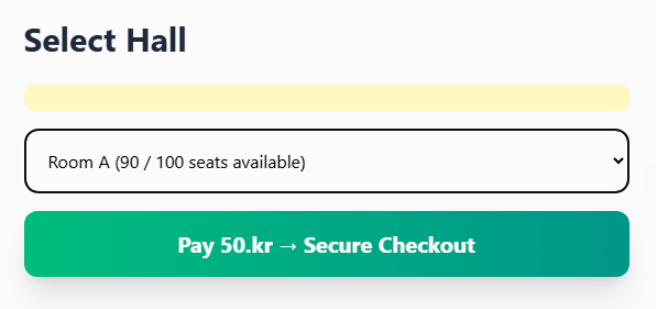

UI purpose:

- Enhances usability by integrating external navigation
- Reduces friction in event planning

Hall Selection and Availability

Users can select an available hall from a dropdown list that displays:

- Hall name
- Total capacity
- Remaining available seats
- Only halls with available seating are shown, preventing invalid selections.

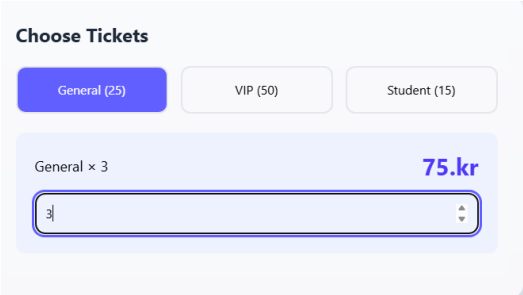

UI purpose:

- Prevents overbooking
- Provides real-time availability feedback
- Ensures data consistency between frontend and backend

Ticket Selection Section

- Users can choose between different ticket types (e.g., General, VIP, Student), each with a clearly displayed price.
- The quantity selector dynamically updates the total price.

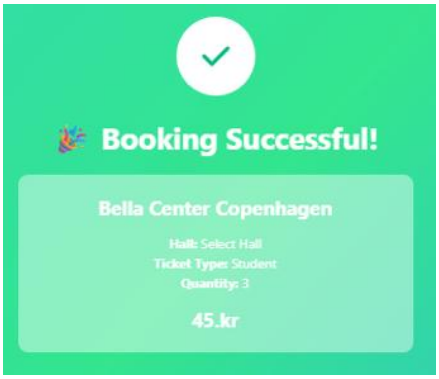

UI purpose:

- Simple comparison between ticket options
- Immediate price feedback
- Supports multiple ticket purchases in one transaction

Booking Flow States

The booking process is divided into three clear steps:

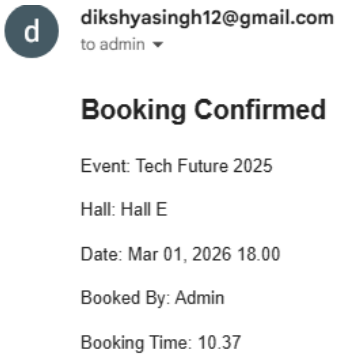

- Selection: User selects hall, ticket type, and quantity
- Payment Processing: A loading indicator confirms the booking is being processed
- Success Confirmation: A confirmation screen displays booking details and next actions

UI purpose:

- Reduces user confusion
- Provides visual feedback during asynchronous operations
- Improves perceived system reliability

Booking Confirmation Screen

After successful booking, users see:

- Event name
- Selected hall
- Ticket type and quantity
- Total price

Users can either:

- Book another event
- Navigate to “My Tickets” to view their bookings

UI purpose:

- Confirms transaction success
- Encourages continued engagement with the platform

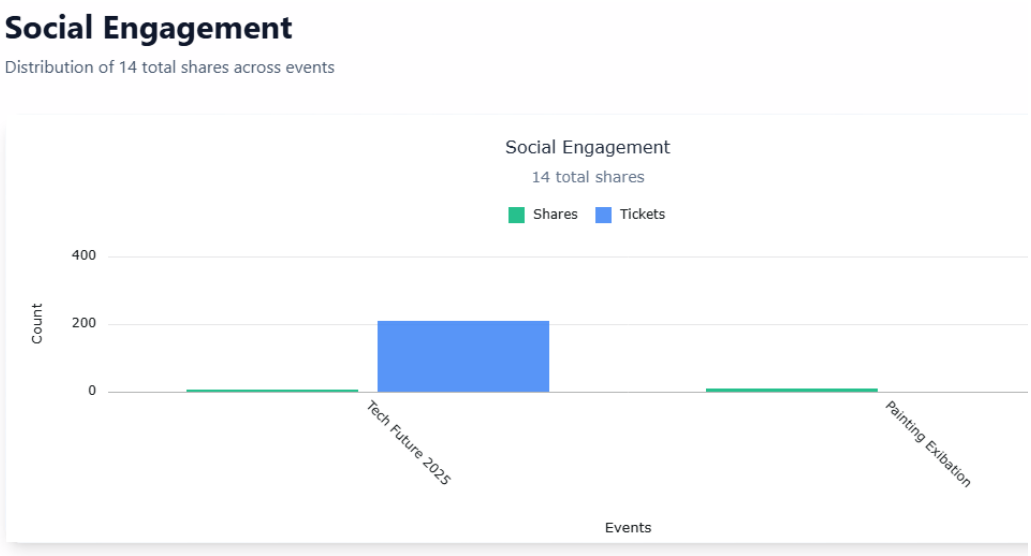

Access Control

This interface is visible to all authenticated users.

Analysis or Visual Diagram

Purpose of the feature:

The Social Engagement Analytics interface provides administrators and event organizers with insights into how users interact with events through social sharing and ticket purchases. The feature supports informed decision-making related to event promotion, platform strategy, and performance evaluation.

Social Engagement by Event (Bar Diagram)

This section presents a comparative view of social engagement and ticket sales across individual events. Each event is represented along the horizontal axis, while engagement metrics are shown on the vertical axis.

UI Elements

- Title: Social Engagement
- Subtitle: Displays the total number of social shares aggregated across all events.

Bar Chart:

- Green bars represent the number of social shares per event.
- Blue bars represent the number of tickets sold per event.

User Value

This feature enables administrators and organizers to evaluate whether social engagement aligns with ticket sales, helping to assess the effectiveness of promotional efforts.

Loading and Data Feedback

While analytics data is being retrieved from the backend, a loading indicator is displayed within the chart area.

User Value

This improves the user experience by providing clear feedback during data loading and ensures that users understand the system is processing requests.

Social Shares by Platform (Donut Chart)

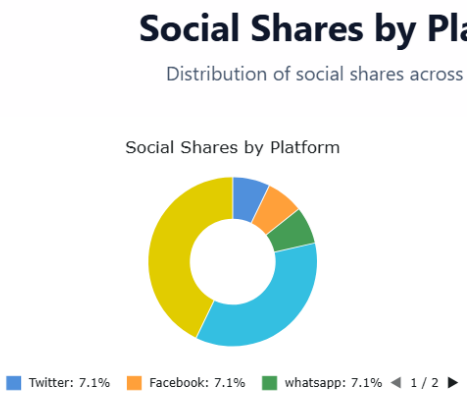

This section visualizes the distribution of social shares across different social media platforms.

UI Elements

- Title: Social Shares by Platform

Donut Chart:

- Each segment represents a social media platform.
- Segment size reflects the percentage contribution of each platform to total shares.

User Value

This allows administrators and organizers to identify which platforms generate the highest engagement and adjust marketing strategies accordingly.

Design and Usability Considerations

Role-Based Access Control:

The interface is only accessible to administrators and organizers, ensuring appropriate data governance.

Responsiveness:

The layout adapts to different screen sizes while maintaining readability.

Visual Clarity:

Clear labeling, consistent color usage, and structured layout improve data interpretation.

Navigation Bar

The navigation bar provides a consistent header across the platform, offering branding, key navigation links, a search function with live category results, and multi-language support (English/Danish). It dynamically adapts to user authentication state, highlights active elements, and responds to scrolling and screen size for a smooth and intuitive user experience.

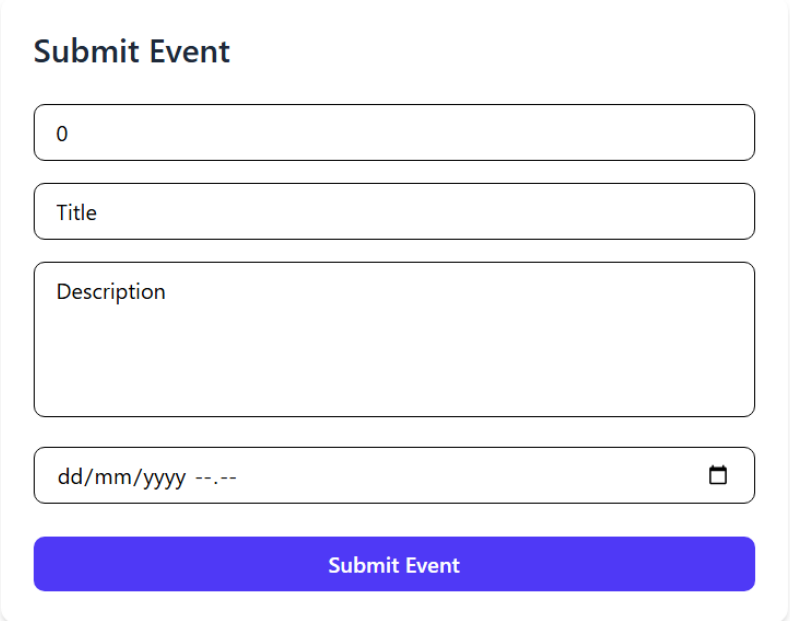

Footer

The footer sits at the bottom of the page, showing about info, services, and quick links.
It includes contact details (email, phone, address) and social media icons.
Links are dynamic and multi-language ready using serviceRoutes and translate.
It improves UX with clickable maps, hover effects, and responsive design.

Event Proposal Form

The Submit Event Component allows organizers to submit new events by filling in details like event ID, title, description, and start time. It uses two-way binding to keep the form inputs synced with the component's submission object. When the user clicks the submit button, the component sends the data to the backend via a service and displays a loading state while waiting for a response. After submission, a message is shown to indicate whether the event was successfully submitted or if an error occurred

Admin Approval List

The Admin Approval Component allows administrators to review event submissions from organizers. It fetches the list of submissions from the backend and displays key details like title, submitter, submission date, and approval status. Admins can approve or reject pending submissions with a single click, and the list updates automatically to reflect changes. Visual status badges and confirmation prompts make the workflow clear, efficient, and user-friendly for managing event approvals.

User Dashboard

The User Profile Component displays detailed information about a user, including name, email, age, gender, 2FA status, and assigned roles. It fetches profile data from the backend using the user's email from the route and shows a loading spinner while retrieving data. Users can view their booked events and see a clear list of permissions associated with each role. If the profile cannot be found, an error message is displayed to inform the user.

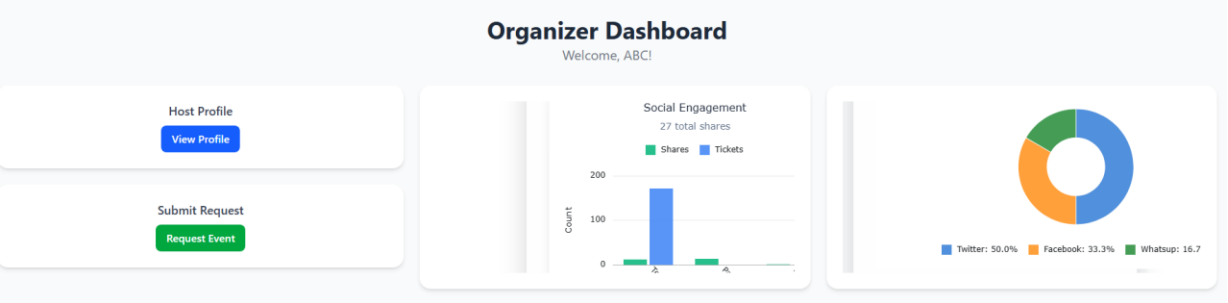

Host Dashboard

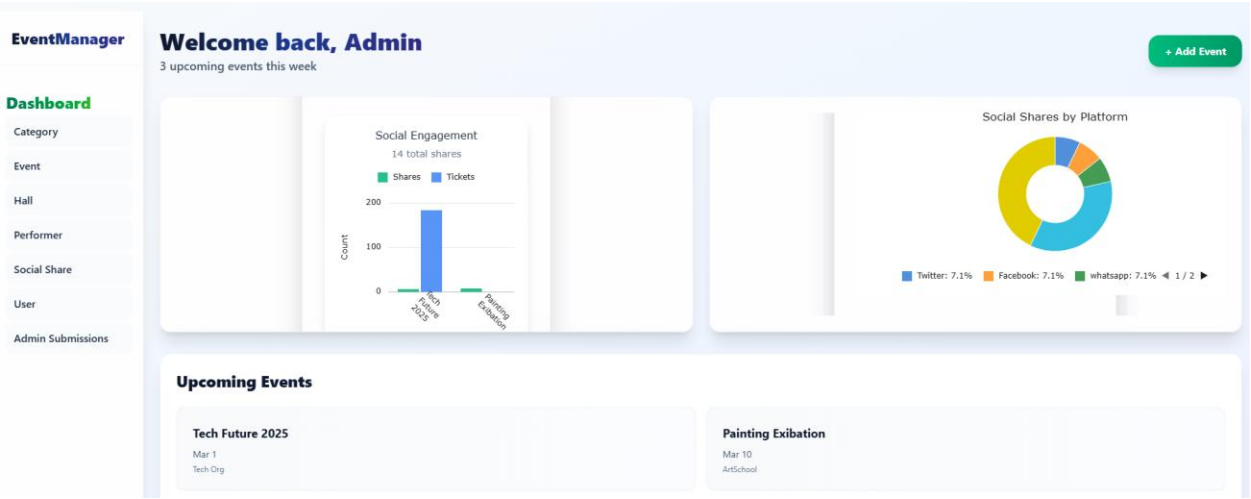

The Organizer Dashboard is a responsive web interface designed using Tailwind CSS to provide a clean and modern layout. It consists of a left section for host actions (profile management and event requests) and a right section displaying analytical charts. The layout adapts to different screen sizes, stacking vertically on mobile devices and displaying side-by-side columns on larger screens. User data is dynamically loaded from the backend using Angular services and JWT-based authentication.

The Organizer Dashboard component provides hosts with a centralized interface to manage their events and monitor performance analytics. It includes quick access sections for viewing the host profile and submitting new event requests. The dashboard also displays interactive data analysis charts that visualize event engagement, ticket activity, and shares. All data is dynamically retrieved from the backend using authenticated user information, ensuring a responsive and personalized management experience across mobile and desktop devices.

Admin Dashboard

The Admin Dashboard Component provides administrators with a centralized interface to manage all aspects of the platform. It displays upcoming events, interactive data analysis charts, and a sidebar navigation for managing categories, events, halls, performers, bookings, tickets, venues, and admin submissions. Admins can quickly add new events and see real-time counts of upcoming events. The dashboard dynamically fetches data from the backend and updates the interface with loading states and responsive content for an efficient management experience.

Full CRUD

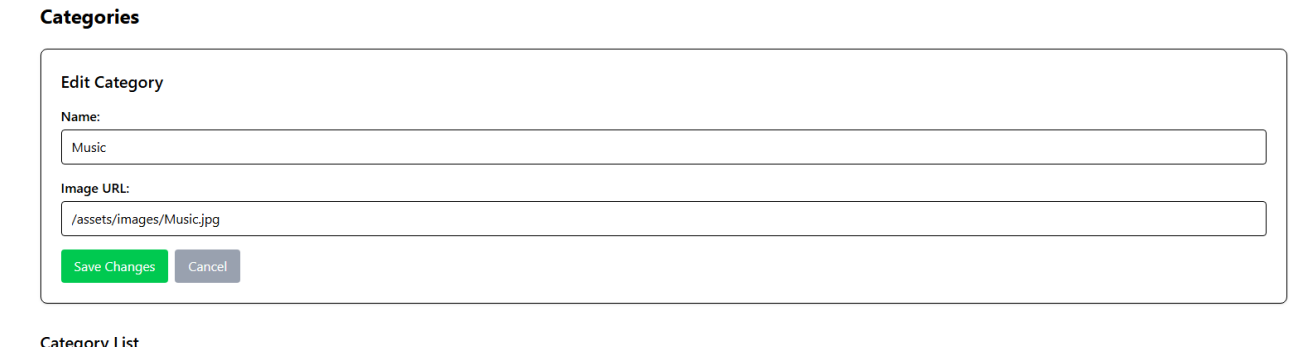

This event management system uses role-based access to control functionality. Admins have full CRUD (Create, Read, Update, Delete) access across all modules, including managing categories, events, halls, venues, tickets, performers, bookings, and event submissions. They can assign organizers and performers to events, approve or reject submissions, and view analytics dashboards.

Hosts have limited CRUD access, mainly for managing performers and the events they are responsible for. Regular users can browse events, book tickets, and manage their own profiles, but cannot modify system-wide data.

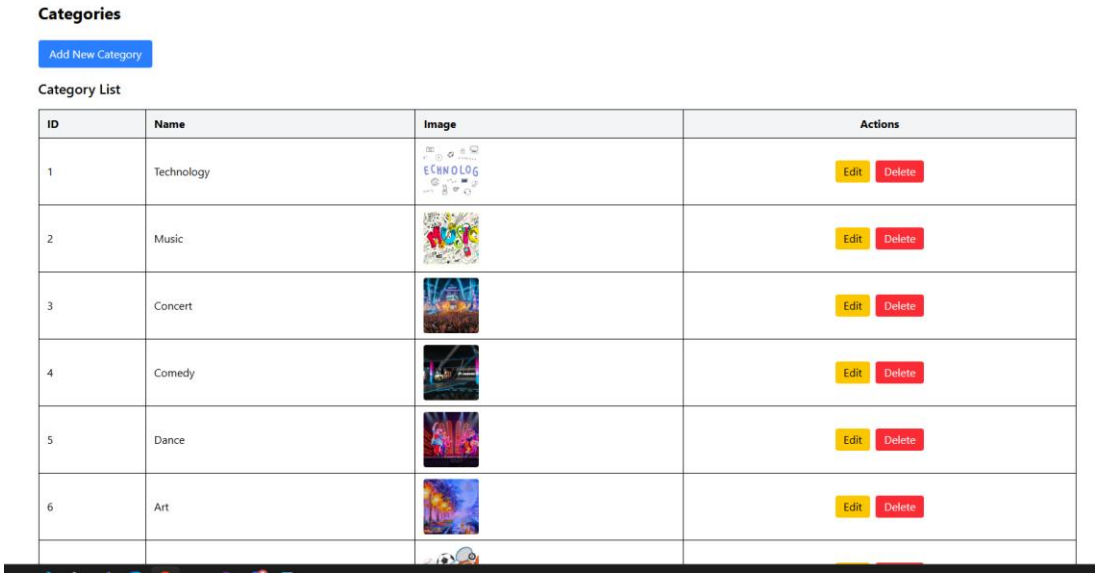

Overall, the system ensures that admins have complete control, hosts can manage performers and events, and users have restricted access, maintaining a clear separation of responsibilities while supporting full event lifecycle management.

Below are the UI tables for each module.

Full CRUD Form of Venue

User Registration

The Registration form allows new users to create an account. Key elements include:

Form Inputs: Email, Password, Full Name, Age, and Gender selection.

Validation: Required fields, email format validation, and age restrictions (min 18).

Buttons: Submit button is disabled until the form is valid; a “Try Again” button appears on error.

Success Feedback: After successful registration, a confirmation message is displayed with a visual success indicator and a link to the login page.

Error Feedback: If registration fails, an error box appears with a clear message and retry option.

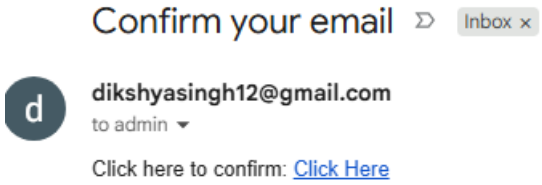

Responsive Design: The form is centered with a clean background, suitable for desktop and mobile screens.

User Value:

This screen provides intuitive and guided registration for new users. Real-time validation and visual feedback improve usability and reduce errors. Clear success and error messages ensure the user always knows the status of their registration.

Email Confirmation & 2FA Setup Screen

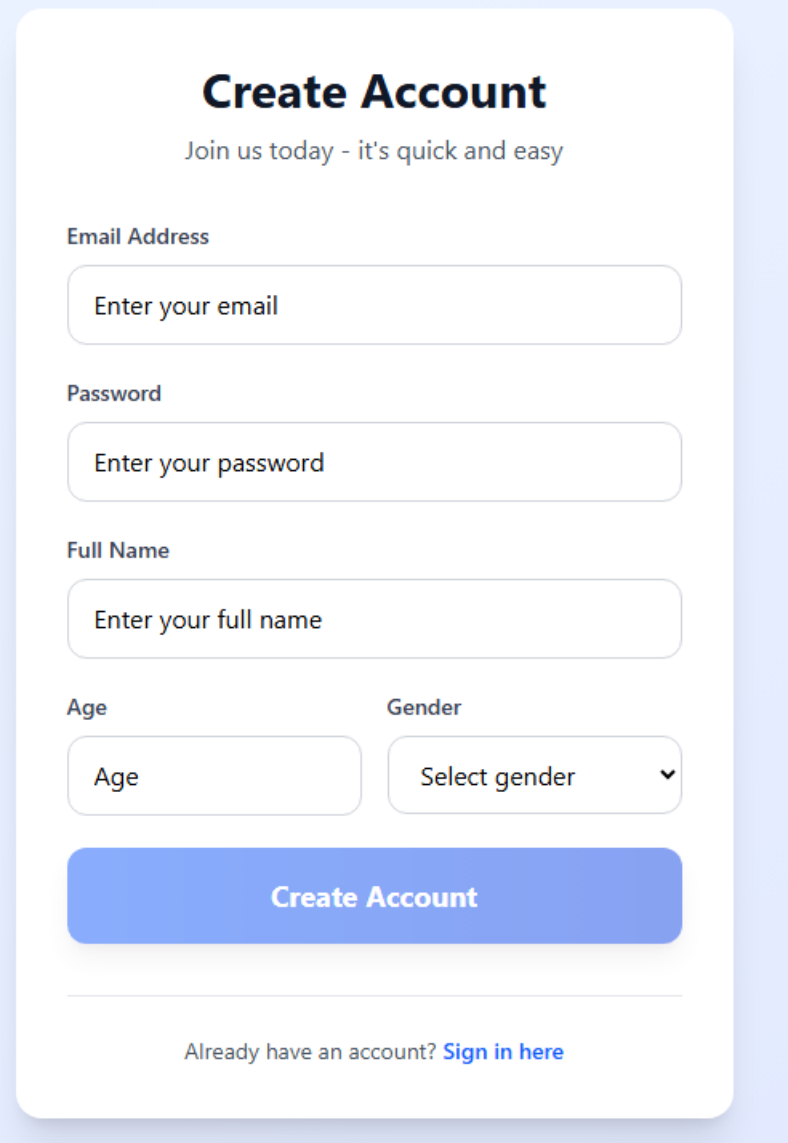

This screen is displayed after a user clicks the email verification link sent during registration. It confirms the user's email address and initiates the Two-Factor Authentication (2FA) setup process. Upon successful confirmation, the system displays a success message along with a QR code that users can scan using an authenticator application (such as Google Authenticator). A manual setup key is also provided for users who are unable to scan the QR code.

User Value:

This screen ensures account verification and enhanced security by confirming the user's email and enabling 2FA. Clear instructions, visual QR code guidance, and fallback manual entry improve usability while maintaining strong authentication standards. A direct login action is provided after successful confirmation to ensure a smooth user flow.

Login / Sign-In Screen

The Login screen allows registered users to access their accounts.

Key features include:

Form Inputs: Email and Password fields with real-time validation. The email field checks for proper format and both fields are required.

Password Visibility Toggle: Users can show or hide the password to reduce input errors.

Error Feedback: If login fails, a clear error message is displayed below the form.

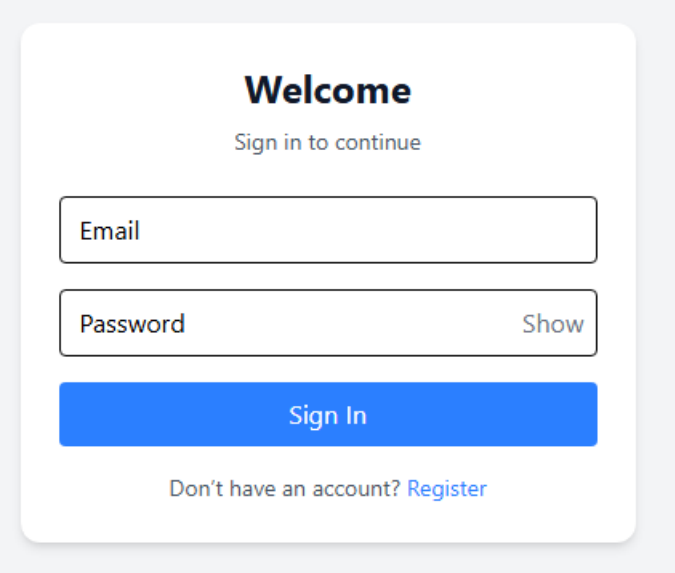

Buttons: Submit button is disabled until the form is valid.

Navigation: Link to the registration page is provided for new users.

Design: The form is centered on the page, with a clean card-style layout and soft shadows for a modern look.

User Value:

This screen ensures secure and user-friendly access to the system. Real-time validation and error messages improve usability, while the password toggle enhances convenience. The clear layout and visual hierarchy guide users through the sign-in process.

Two-Factor Authentication (2FA) Screen

The 2FA screen is displayed after a user successfully enters their credentials during login. It adds an extra layer of security by requiring a 6-digit authentication code generated by an authenticator app.

Key elements include:

Code Input: A single field where the user enters the 6-digit verification code. It is validated to ensure input is provided.

Submit Button: The "Verify" button is disabled until a valid code is entered, preventing incomplete submissions.

Error Feedback: If the code is invalid or verification fails, a clear error message is displayed below the form.

Design: The form is centered on the page inside a card layout with shadows and rounded corners, providing focus and clarity.

User Value:

This screen ensures enhanced account security by implementing two-factor authentication. Users are guided clearly with instructions, input validation, and immediate feedback, which

improves trust and usability. Once verified, the system routes the user to their respective dashboard based on role (Admin, Host, User).
