CASE DESCRIPTION: DIXEN

Dixen is a modern, all-in-one event management and ticketing system designed to simplify the process of discovering, registering for, proposing, and organizing events. The platform is built to serve multiple user roles, including regular users, event organizers, and administrators, offering a secure, scalable, and user-friendly experience. Dixen integrates advanced features such as email confirmation, two-factor authentication (2FA), role-based access control, social media sharing, event reviews, and comprehensive booking and ticket management to ensure a seamless and trustworthy user experience.

The system enables users to browse, search, and filter events based on criteria such as date, price, category, and event type. Detailed event pages provide information about venues, halls, performers, available tickets, and remaining capacity. Users can purchase tickets, submit reviews, and share events across different social media platforms. Social sharing activity is tracked and used to support event popularity insights and recommendations.

Event organizers can submit requests to create events and manage events that they have created. This includes editing event details, managing venues and halls, assigning performers, and configuring ticket types and pricing. Event submissions require administrative approval to ensure quality and platform integrity.

Administrators have full control over the system and are responsible for managing users, roles, events, categories, venues, bookings, and reviews. They also oversee event approval workflows, monitor social sharing statistics, and ensure system security and data consistency.

PURPOSE

The primary goal of Dixen is to make attending and managing events easier, safer, and more interactive for all stakeholders involved. By implementing secure authentication mechanisms such as email verification and two-factor authentication, Dixen ensures that user accounts and sensitive data are protected. The system promotes trust and reliability through controlled event approval processes and role-based permissions.

For users, Dixen provides a streamlined way to discover relevant events, book tickets, and engage with the community through reviews and social sharing. For organizers, the platform offers comprehensive tools to manage the full event lifecycle—from initial proposal and

approval to ticket sales and event execution. Administrators benefit from centralized system control, allowing efficient moderation, maintenance, and oversight of all platform activities.
